

# ISLP Labs

Last modified: 2026-09-28

A Quarto website that hosts handouts for the labs in *An Introduction to Statistical Learning with Applications in Python* (ISLP), starting with **Chapter 7 — Non-Linear Modeling**. The handouts re-organize each lab as a sequence of exercises with hide-able solutions, so that students can attempt the steps themselves before revealing the worked code.

The lab content is adapted with permission from the source available at <https://www.statlearning.com>, and tracks the upstream [intro-stat-learning/ISLP\\_labs](https://github.com/intro-stat-learning/ISLP_labs) repository.

## 1 Available handouts

- [Chapter 7 — Non-Linear Modeling](#)

## 2 R alternative

Students who prefer to work in R may follow the corresponding chapter of Emil Hvitfeldt's [ISLR tidymodels labs](#).

## 3 Original labs

The full set of original ISLP labs (Chapters 2–13) is available as Jupyter notebooks in the [intro-stat-learning/ISLP\\_labs](https://github.com/intro-stat-learning/ISLP_labs) repository.

## 4 Building the handouts

Two parallel renders of the website are produced — a **student worksheet** (prompts only) and a **solution key** (solutions only) — each written to its own subdirectory of `_site/`. The exercise/solution toggling is provided by the [coatless-quarto/assign](#) Quarto extension.

Render the solution key (the default profile):

```
quarto render
```

Render the student worksheet:

```
quarto render --profile assign
```

The published GitHub Pages site combines both — its top-level `index.html` links to `assign/` and `solution/`.
